Universal Driver Recognition

Red and Green lights show Status Clearly

Displays provide total spaces available for each level

Identifies every spot

Moves parkers to exact locations

Lessens driver frustration while revenues increase

Fills Garage Completely

Pays for itself in increased revenues

Manpower needs reduced

Garage Utilization records available for planning and verification

Less pollution from vehicles

Integration concepts

Designed for use with

AUTOPARK

or for standalone use

Can be integrated into

parking systems, loop count programs

Summary level space available indicators

Turnkey system capabilities

Hardware, software, installation, service programs available

Experienced program managers

Space Finder can make sure your parkers find the best space available in your garage.

Sensors are located over each space. The sensors verify the absence or presence of vehicles underneath.

There is a mode available to manually open or close a space for maintenance should your operators need to.

The sensors have red and green lights that alert the drivers of parking space status. In the normally shaded environment of a garage, the open spaces are easy to identify at great distance. The sensors are low voltage units for increased safety in your garage.

The entire system uses very little power, for minimal operational cost. The system is designed to require little maintenance, because of the smart, auto adjust sensors. Parkmatic sensors are safe units using low voltage rather than 220 volt European models. This is important with all the racks on vehicle and SUVs. Led Displays can be placed at the garage entrance, at each floor, and also at the ends of each row. This will readily guide driver to open spaces.

This system is especially effective in garages that are at near or at capacity. The last space is as easy to identify as at half capacity. The system minimizes the continual need for manpower to verify the status of availability within the garage, and most importantly, the information is current and accurate. The system can be installed in limited areas or throughout the garage.

Central control systems are also an option to allow management supervision and display control. Special sensors are available for rooftop or open usage where additional lamp brightness is necessary.
